PROJECT OVERVIEW

- “Harnessing Machine Learning to Estimate Aquaculture Production and Value Chain Performance in Bangladesh”
- Worked in seven main aquaculture districts in SW Bangladesh in 2020-21
- **Component 1** Survey a representative sample of 721 farmers, 329 fish traders, 79 feed suppliers, 80 hatcheries
- **Component 2** Use machine learning to extract and analyze data on aquaculture from remotely sensed images;
- Combine with survey data to estimate aquaculture’s contributions to the regional economy

METHODOLOGY

- Estimated total aquafarm area in 7 districts of S Bangladesh from remote sensed images using machine learning.
- From survey, calculated average rates of: Farm productivity (t/ha); Gross revenue (farmgate value + own consumed & gifted value); Gross margins (gross revenue - production costs); Feed use (t/ha); Employment (FTEs/ha)
- Multiplied per ha average by total area to estimate total: Quantity of production, Value of production, Farm income, Amount of feed used, Jobs created.
- Can use same technique to estimate total production of micronutrients & number of people employed upstream and in downstream value chains in the same districts

DIFFERENCES IN FIL ESTIMATED & DOF REPORTED PRODUCTION

CONCLUSIONS

- Machine learning estimates of total farm area similar to DOF stats
- Massive contribution to GDP, farmer incomes, employment
- Lower estimates of shrimp + prawn production (31%) compared to DOF: reflects COVID effect (-25%)
- Much higher fish (41%) and total (27%) production estimates - shift from shrimp to fish + huge increase in pelleted feed.
- Potential for combining remote sensing & machine learning + representative surveys to estimate a wide range of statistics.
- Further work ongoing to estimate off-farm employment in aquaculture value chain and production of nutrients.
- Potential for expansion of approach to whole country/other countries.
